Rush search request for 09/991681

I am sorry that this is the third time that I ask you for this case. Since I could not find any decent art even for fragments of SEQ ID NO:27, could you please search in commercial database, PGPUB and issued patent files: Oligomer search for SEQ ID NOs: 27-31.

Thank you.

If you want me to submit a new search request to the library, please let me know. MINH TAM DAVIS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a number of prostate-specific sequences derived from the human PS118 gene. These can be used in the detection, monitoring and treatment of prostate diseases, particularly prostate cancer. The present sequence is a PS118 protein fragment of the invention. The coding sequences of the invention were isolated from a prostate tissue expressed sequence tag (EST) library.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              #XCXCCCCCCCCCCCCCCCCX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   comprising amino acids 393-441 of human prostate-specific PS118

comprising amino acids 393-441 of human prostate-specific PS118

comprising amino acids 393-441 of human prostate-specific PS118

comprise the sequence (see ABM50809). A PS118 consensus sequence (see ABM50815) is found at least 12 times more often in prostate than in non-prostate tissue. PS118 polypeptides, polynucleotides, and tibodies, agonists and inhibitors are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and treating (including by genetic immunisation), or determining the predisposition of an individual to, diseases and conditions of the prostate, such as benign prostatic hyperplasia, prostatitis, prostate; intraepithelial neoplasia, prostate cancer, tumours and metastases. The PS118 polypeptides can be produced by expression of PS118 polymucleotides in transfected host cells, and immunogenic peptides are useful for raising PS118-specific antibodies of diagnostic use. The methods and reagents of the prostate and may also provide new markers which can differentiate between the clinically important and unimportant prostate cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a number of prostate-specific sequence derived from the human PS118 gene. These can be used in the detection, monitoring and treatment of prostate diseases, particularly prostate cancer. The present sequence is a PS118 protein fragment of the invention. The coding sequences of the invention were isolated from a prostate tissue expressed sequence tag (EST) library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel PS118 polypeptide for detecting, diagnosing, staging, monitoring prognosticating, preventing, treating, or determining predisposition individual to diseases and conditions of prostate, e.g. prostrate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a human prostate-specific PS118 polypeptide, as predicted from a partial consensus cDNA sequence (see ABA91651), and lacking the N-terminal region. The PS118 consensus sequence is found at least 12 times more often in prostate than in non-prostate tissue. PS118 polypeptides, including derivatives of the present sequence, polynucleotides, agonists and inhibitors are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and treating (including by genetic immunisation), or determining the prostate, such as benign prostatic hyperplasia, prostatitis, prostate intraepithelial neophasia, prostate cancer, tumours and metastases. The PS118 polypeptides can be produced by expression of PS118 polypeptides in transfected host cells. The methods and reagents of the invention may provide an early means of detecting diseases of the prostate and may also provide new markers which can differentiate between the clinically important and continuous cancer, which can differentiate cancers without the use of surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc and gene mapping, and in récombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags cc for identifying expressed genes. (I) is useful in gene therapy techniques cc trestore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or cquantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical cc maging of sites expressing (II). (I) and (II) are useful for treating cd insorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity cand to produce other types of data and products dependent on DNA and cando acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.

CC hybridisation probes, primers for PCR, for chromosome and gene mapping, CC for the recombinant production of protein, or in generation of anti-sense CC DNA or RNA. The polynucleotides are useful in diagnostics as expressed CC sequence tags (RSTs) for identifying expressed genes or for physical CC mapping of the human genome. The proteins may be used as molecular weight CC markers, or as nutritional sources or supplements. The proteins may be used to maintain and expand cell population in a totipotential or CC pluripotential state useful for re-engineering damaged or diseased CC tissues, transplantation, manufacture of bio-pharmaceuticals or the CC development of bio-sensors. The polynucleotides and proteins are useful CC protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral nervous system diseases, mechanical and traumatic CC disorders, non-healing wounds, immune deficiencies and disorders, CC disorders, or cancer. The polynucleotide sequences of the invention were diseases sequences obtained from one or more public databases.

CC note: The sequence data for this patent did not form part of the printed of specification, but was obtained in electronic format directly from WIPO careful parts. The polynucleotide in some cases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC imaging of sites expressing (II). (I) and (II) are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful in reating CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations (CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC series wino intrinubnished not segmences of communications of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. It is a supplementable of the human adult liver. The genes cidentified may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes cidentified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting
                                                                                           New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -
                                                                                                                                                                                                                                                                                                                                                                                                                          09-AUG-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC the probes with a collection of detectably labelled nucleic acids CC derived from mRNA of human breast, and then measuring the label CC bound to each probe of the microarray. The probes are useful for CC verifying the expression of regions of genomic DNA predicted to CC encode proteins. They are useful for gene discovery, and for CC determining predisposition and/or prognosing breast disease. Gene CC expression analysis is useful for assessing the toxicity of chemical CC agents on cells. The microarray of this invention presents a far greater CC diversity of probes for measuring gene expression, with far less bias CC than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The gresent sequence is a peptide encoded by a single exon nucleic acid CC probe of the invention.

CC Note: The sequence data for this patent did not form part of the CC printed specification, but was obtained in electronic format directly crom wife at figure in the published pct sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                           04-FEB-2000;

                                                       measuring human gene expression in a sample derived from human heart (see ABA2133-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                       Penn

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used the gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful analyzing gene expression in human bone marrow \boldsymbol{\cdot}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human bone marrow expressed probe encoded protein SEQ ID NO: 28586.

                                                                                                                                                                                                                    The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
